Opportunities 🌸

I have a great opportunity with unique ideas, growth and team communication skills. I could really take advantage of my ability to soak up information and become a productive member of a team.

Threats 🔥

A threat towards me would be someone with a superior ability to code. It may become a problem later in my career if someone also proves to have better ideas than me or if they can out perform me in efficiency.

Strengths 💪

Strengths 💪

I think personally i have a lot of great unique individual ideas that may help me or my team reach an end goal, I'm typically quite flexible in roles. I think as well as in designs i show a lot of enthusiasm towards the actual design process of a model.

Strategies to make use of **Opportunities** through our **Strengths**

A great strength i have is clear communication and people skills, i could request criticism with aspects i struggle with in order to improve myself and the end results.

Strategies to prevent **Threats** through our **Strengths**

If someone may be more efficient than me, can code better than me or outperform me in creative ideas and solutions then its very clear what i must do. I must improve by exploring their work and what they are doing that's successful and working and i need to take that and improve it. If i cannot code as well as them i need to make sure i out perform them with one my strengths such as ideas.

Weaknesses? 📉

Weaknesses? 📉

I'm not a good coder, i haven't coded ever actually, i think i could definitely use more time on blender but i feel that using the tools and realising a design will become second nature but as of yet i am not skilled but looking forward to using blender. Admittedly i am terrible with deadlines as well.

Strategies to make use of **Opportunities** to minimize **Weaknesses**

I need to communicate and develop my understanding of coding within my team, my time and research. Ultimately i can easily mitigate my juvenile understanding of blender by practicing in my own time.

Strategies to minimize the potential dangers lying in sectors where **Weaknesses** meet **Threats**

Avoid coding as a job, maximise efficiency but don't sacrifice quality for quantity. Be consistent in workload and appropriate within it to meet deadlines. Always take on board criticism as it will help you grow and become a better 3D artist.
